Getting Started — For developers

This page orients you if you are going to work on Candex. For the product itself — what it is and how it feels to use — start with Getting Started — Product.

The system at a glance

Candex is not one app but a few pieces working together. Users touch the **mobile app**. An **admin dashboard** keeps the drink catalogue accurate. Both talk to a single **REST API**, which holds the domain and stores everything in **PostgreSQL**. Sign-in is handled by **Firebase**.

Repositories

The workspace holds six repositories. Three are the live system above; the others are either superseded or early.

Repository	Role	Status
`candex-app`	Mobile client (Angular + Ionic + Capacitor)	Active
`candex-dashboard`	Admin dashboard for managing the catalogue	Active
`candex-api`	REST API and domain model, backed by PostgreSQL	Active
`candex-backups`	Firestore backup tooling	Deprecated — predates the move to PostgreSQL
`candex-api-legacy`	Previous API (Node.js / Express)	Deprecated
`candex-ai`	AI module (Python)	Early / placeholder

Tech stack

Front-end — the mobile app and the admin dashboard

- **Angular** v20
- **Ionic** v8
- **Capacitor** v7
- **TypeScript**
- **NgRx** Store • Effects • Entity
- **RxJS**
- **Angular Material** dashboard
- **Firebase** Auth

Back-end — the REST API

- **Spring Boot** v3.5
- **Java** 21
- **Maven** build (wrapper)
- **PostgreSQL**
- **Flyway** migrations
- **MapStruct** mapping

OA2 **Spring Security**
OAuth2

OpenAPI
springdoc

Quality & delivery

Docker
Compose

JU **JUnit**
+ Mockito

Tc **Testcontainers**

Jc **JaCoCo**
couverture

ESLint

Cypress
e2e

Where things live

- **Domain & API** — `candex-api`. Entities and business rules in `src/main/java`; schema in PostgreSQL, evolved through Flyway migrations under `src/main/resources/db/migration`.
- **Mobile UI** — `candex-app` (Angular + Ionic, NgRx for state).
- **Admin UI** — `candex-dashboard` (Angular + Ionic + Angular Material).

The codebase is the source of truth: when documentation and code disagree, the code wins and the docs are corrected.

Running it locally

Candex runs as three apps — the mobile app and the dashboard (Ionic/Angular, run with npm) and the API (Maven + Spring Boot, with PostgreSQL), each in three environments (local, dev, prod). The full setup — prerequisites, cloning, environment files, the database, and the per-app commands — lives in the **Local Installation** handbook *(planned)*.

Where to go next

- Set up your machine → Local Installation *(planned)*
- Understand how the pieces fit, and why → Architecture & Overview *(planned)*
- The precise domain language → Glossary / Domain *(planned)*

Your first step: clone the repositories, then follow Local Installation to get the API and at least one front-end running against a local database.
